

Evaluating Large Language Models' Human-Like Social Reasoning Processes on Socially Subjective Tasks

Thank you for participating in our study!

We are investigating whether large language models can generate human-like social reasoning processes when addressing subjective and controversial social issues.

You will read 7 sets of questions. Each set **begins with** a "human-standard" text (written by a real person), followed by **three texts generated by different LLMs**. Each text segment includes (a) the reasoning process used to consider the issue and (b) the final choice.

For each set of questions, you will need to answer five multiple-choice questions:

1. **Logical Consistency**—Which of the three LLM-generated reasoning texts presents logic most consistent with the "human standard"?
2. **Semantic Consistency**—Which of the three LLM-generated reasoning texts uses concepts, terminology, and phrasing most similar to the "human standard"?
3. **Information Coverage** — Among the three reasoning texts generated by LLMs, which one covers the key information points mentioned in the "human standard"?
4. **Cognitive Similarity** — Among the three reasoning texts generated by LLMs, which one's perspective, approach, and thought process most closely resemble the "human standard"?
5. **Overall Score** — Overall, which of the three LLM-generated reasoning texts is most similar to the "human standard" reasoning text?

There are no right or wrong answers to these questions—we simply need your direct assessment of whether the reasoning is reasonable and aligns with human thinking. The survey takes approximately 15 minutes to complete and is completely anonymous.

Detailed Instructions:

1. First, read the demographic information (age, occupation, income, etc.) and the given social issue.
2. Read the "human standard" text to understand this person's reasoning style.
3. Read the three texts generated by the LLM (the order of the three LLMs is randomized for each question).
4. **Logical Consistency**: Select the one with the clearest logical process, free of contradictions, and most aligned with the "human benchmark" approach.
5. **Semantic Consistency**: Select the one whose concepts, terminology, and phrasing most closely resemble the "human standard."
6. **Information Coverage**: Select the one that most comprehensively covers the key points of the "human standard."
7. **Cognitive Similarity**: Select the one whose perspective, methods, and thought patterns are closest to the "human standard."
8. **Overall Score**: Overall, select the option that is most similar to the "human standard" as a whole.

*Required Questions

Case 1

Personal Information

Gender: Male Age: 51-60

Education: Bachelor's degree

Occupation: Retired Income: 10,000-100,000 yuan

Question:

Do you agree with the following statement: Husbands and wives should share household chores equally?

List of options:

"Strongly Disagree", "Somewhat Disagree", "Don't Care", "Somewhat Agree", "Strongly Agree"

Respondent Criteria:

A couple shouldn't get hung up on whether household chores are divided equally; there's no need to be overly particular about it. Chores should be handled by whoever sees them needing to be done and takes the initiative to do them—there's no need to deliberately assign specific tasks.

Selection: Somewhat disagree

Text A:

I'm retired now, so my life is relatively comfortable, and I have fewer family responsibilities. Traditional views have always emphasized that men are the head of the household and women take care of the family. Although these traditional views aren't as prominent as they used to be, they still exist in many families. Family relationships are private matters that should be resolved through mutual discussion between both parties. There is no need to enforce strict equality, and one cannot make a blanket statement that responsibilities must be shared equally.

Choice: Somewhat disagree

Text B:

With over a decade of marriage experience, I have a deep understanding of family life. Under traditional views, men may be more inclined to believe that

should shoulder more household responsibilities, particularly given their role as the primary breadwinners. However, as society evolves, gender norms are gradually shifting, and more people support an equal division of labor. In practice, responsibilities should be allocated based on each partner's work schedule and capabilities, but the overarching principle of equality should be upheld. Therefore, I somewhat agree that couples should share household chores as equally as possible, though adjustments may be necessary in practice. Selection: Somewhat agree

Text C:

Traditionally, men were expected to work outside the home while women handled household chores. However, with changes in modern lifestyles, both partners may work, or one partner may be better able to take on more household responsibilities. Therefore, sharing household chores has become a more practical approach. Considering gender equality and trends in modern society, an equal division of household chores is a relatively common and reasonable practice. Therefore, selecting "Somewhat Agree" is more appropriate.

Choice: Somewhat agree

Which of the following reasoning passages is most consistent with "human standards" (Logical Consistency)? *

- ☐ A
- ☐ B
- ☐ C

Which passage uses concepts, terminology, and expressions most similar to "human standards" (Semantic Consistency)? *

- ☐ A
- ☐ B
- ☐ C

Case 2

Demographic Information

Gender: Female Age: 28–40

Education: Bachelor's degree

Occupation: Teacher Income: 10,000–100,000 yuan

Question:

Do you agree with the following statement: Couples should share household chores equally?

Options:

"Strongly Disagree", "Somewhat Disagree", "Don't Care", "Somewhat Agree", "Strongly Agree"

Criteria:

Married couples should share household chores equally because both partners are part of this small family unit; husbands and wives are equal and should share family responsibilities together.

Selection: Somewhat agree

Text A:

Housework is inherently a reflection of household management and daily affairs. An equal division of labor means that each person has equal responsibility and a sense of participation in family matters. Adults should respect and assist one another, jointly handling the daily chores and logistical tasks of the household. Otherwise, it will lead to some people passively accepting others' arrangements and becoming mere appendages of the household labor force—a phenomenon that has become increasingly evident in reality. Therefore, I believe that couples should reach a consensus on the principle of equal sharing, as this is the only way to foster mutual support and cooperation, thereby making family relationships more stable and harmonious.

Option: Somewhat agree

Text B:

As a teacher, I place great emphasis on equality and fairness, particularly in highlighting these values within education. Having been married and living with a partner for some time, I have experienced the challenges of dividing labor between spouses and thus have practical insights into this topic. My financial situation is relatively stable, and I possess a certain capacity for rational thinking, enabling me to analyze and discuss such family issues. The division of household chores is related to gender equality. It emphasizes the responsibilities and contributions of each family member, and I am more inclined to support an equal division of labor. As long as both parties are willing and capable, household chores should be shared equally, which will lead to more harmonious family relationships. Overall, I tend to agree, because my profession, age, and education all support the value of equality.

Selection: Somewhat agree

Text C:

Traditionally, women are more likely to take on household chores, though this may vary depending on career or personal circumstances. I am in the prime of my family life, have professional experience, am well-versed in daily living, and have a steady income. Since I occasionally work overtime, sharing household responsibilities can affect my work-life balance. Traditionally, women have been responsible for household chores, but as awareness of gender equality grows, more and more people support an equal division of labor. As a relatively young middle-aged woman, I have embraced this perspective and believe that household chores are a shared responsibility between spouses. Sharing household chores is not merely an economic issue; it is also a reflection of emotional connection and mutual respect. If a partner is unwilling to share the burden, it may affect the quality of the relationship. Therefore, I am more inclined to support an equal division of labor, as this helps maintain balance and mutual respect in the relationship.

Option: Somewhat agree

Case 3

Demographic Information

Gender: Female Age: 18-27

Education: Bachelor's degree

Occupation: Student

Question:

Suppose you are participating in an experiment and are randomly paired with another player online. You do not know who the other person is, and they do not know who you are. Suppose you currently have 5 yuan. You can give the other person N yuan, and they will receive $3N$ yuan, after which they can choose how much to return to you. Your payoff = $5 - N$ + the amount returned by the other player. The other player's payoff = $3N -$ the amount returned by the other player. How much would you give the other player?

List of options:

"N=0", "N=1", "N=2", "N=3", "N=4", "N=5"

Human standards:

I don't believe the other person would be willing to return the money to me, unless they are exceptionally kind-hearted and trustworthy. However, I think such people are relatively rare in society, so I choose to keep the five dollars without any reason and stop taking risks.

Choice: N=0

Text A:

Suppose I give the other party N yuan, and they receive $3N$ yuan. Then the other party can choose to return a portion or all of it to me. My payoff is 5 yuan minus N yuan, plus the portion returned by the other party; while the other party's payoff is $3N$ yuan minus the portion they return to me. My goal is to maximize my own profit, while also potentially considering the other party's profit, because sometimes the other party will decide how much to return based on their own profit. For example, if the other party knows I will give N yuan, they might decide how much to return based on the value of N . Let me analyze each option: 1. $N=0$: I give 0 yuan, the other party receives 0 yuan, and cannot repay. The other party's payoff is 0 yuan; they might feel this is disadvantageous to me, so they might not repay. Thus, my payoff is $5 - 0 + 0 = 5$ yuan. Since the other party has no payoff, they might choose to repay 0 yuan, but the other party would not be willing to do so and might choose not to repay. Now, I need to consider the other party's strategy. The other party will decide how much to repay based on the value of N . Assuming the other party is rational, they will choose to maximize their own payoff, which may also affect my payoff. For example, when $N=1$, the opponent might return 1 yuan, because this gives them a payoff of 2 yuan, while I receive 5 yuan. This creates an equilibrium for both parties; this may be a Nash equilibrium, because the opponent cannot action to increase their payoff. However, when $N=2$, the opponent might pay back 2 yuan, because this way they receive 4 yuan, and I get 5 yuan. Similarly, the other party might choose this strategy. However, if I choose $N=0$, the other party might not pay me back because they get 0 yuan; they might not be willing to pay, so they might choose not to pay. In that case, my payoff is 5 yuan, and the other party gets 0 yuan. However, the other party might not act this way, as they might want to repay at least some amount, or they might be unwilling to repay at all, resulting in my payoff remaining at 5 yuan. A more realistic scenario, however, is that the other party will decide how much to repay based on the value of N . For example, when $N=1$, the other party might repay 1 yuan, and when $N=2$, the other party might repay 2 yuan, and so on. To summarize, a possible strategy is that when $N=1$, the other party chooses to repay 1 yuan, resulting in me receiving 5 yuan and the other party receiving 2 yuan. This is a Nash equilibrium because the other party cannot achieve a higher payoff by changing their repayment amount. However, when $N=2$, the opponent might repay 0 yuan, resulting in me receiving 3 yuan and the opponent receiving 6 yuan—which is a worse outcome, so $N=1$ is preferable. Therefore, I might choose $N=1$: the opponent repays 1 yuan, I receive 5 yuan, and the opponent receives 2 yuan—which is likely a reasonable choice.

Choice: N=1

Text B:

Suppose I choose to give N yuan, and the other party receives $3N$ yuan. The other party can then choose how much to return to me. The other party's objective is to maximize their own payoff, which is to maximize $3N$ minus the amount returned to me. I need to think from the other party's perspective to deduce how much they will choose to return. Then, I'll determine the value of N based on my own payoff. Let me first consider the other party's decision. The other party receives $3N$ yuan and can then choose to return any amount between 0 and $3N$ yuan. The other party's payoff is $3N$ minus the amount returned. The other party will choose to maximize their payoff, which means returning as little as possible, because the larger the difference between $3N$ and the amount returned, the better. However, the other party will also consider how I might respond. They might predict that I will choose a different value of N and react accordingly. Now, I need to choose N to maximize my payoff while taking the opponent's choice into account. I need to find the value of N that maximizes $5 - N$ + the repayment amount, assuming the opponent chooses to repay 0. Therefore, I need to choose N such that $5 - N$ is maximized, meaning N should be as small as possible. Since the options for N range from 0 to 5, if I choose $N=0$, the other party receives 0 yuan, and their payoff is 0 yuan; they might not be willing to repay any money, or they might repay 0 yuan. However, can I choose a higher value of N to maximize my payoff? For example, if I choose $N=1$, the other party receives 3 yuan. They might choose to return 0 yuan, so my payoff is $5 - 1 + 0 = 4$ yuan, and the other party's payoff is $3 - 0 = 3$ yuan. This is lower than my payoff when $N=0$, so $N=0$ is better. Similarly, if I choose $N=2$, the other party receives 6 yuan, and they might choose to return 0 yuan, then my payoff is $5 - 2 + 0 = 3$ yuan, and the other party's payoff is 6 yuan. This is lower than when $N=0$, so $N=0$ is better. Similarly, for $N=3$, my payoff is $5 - 3 + 0 = 2$ yuan, and the opponent's payoff is 9 yuan. For $N=4$, my payoff is $5 - 4 + 0 = 1$ yuan, and the opponent's payoff is 12 yuan. For $N=5$, my payoff is $5 - 5 + 0 = 0$ yuan, and the opponent's payoff is 15 yuan. Therefore, from my perspective, choosing $N=0$ yields the maximum payoff of 5 yuan, while the opponent receives 0 yuan. Thus, I choose $N=0$, receiving 5 yuan, while the opponent receives 0 yuan and pays 0 yuan.

Choice: N=0

Text C:

I don't think I should give the other person a single penny. Five yuan is already quite generous of me, and once I give it away, I'm not sure if they'll give me any money back—after all, they don't know who I am. Even if the other party receives $3N$ yuan, they might still choose not to pay me back. In this situation, I should keep my money, avoid taking this risk, and prioritize my own interests and safety.

Option: N=0

Case 4

Demographic Information

Gender: Female Age: 60 or older Education: Bachelor's degree Occupation: Healthcare Professional Income: 100,000 to 500,000 yuan

Question:

How do you view the choice between "early retirement" and "working until retirement age"?

List of options:

"Strongly prefer early retirement", "Somewhat prefer early retirement", "Undecided", "Somewhat prefer working until retirement age", "Strongly prefer working until retirement age"

Human Standards:

The meaning of life lies in striving. Humans are social creatures who need to interact with others. In the process of serving others and working, it is actually others who fulfill you. Be grateful to those who provide job opportunities and to the people you serve; it is they who give you a sense of meaning in life.

Preference: Tends toward lifelong work

Text A:

Considering individuals aged 60 and above, there is typically a stronger inclination toward retirement. Healthcare workers face high job intensity and may feel exhausted toward the end of their careers; early retirement could give her more time to enjoy life and rest and recuperate. Second, with incomes ranging from 100,000 to 500,000, they fall into the middle-to-high income bracket. Although their financial situation is favorable, the high stress of healthcare work may lead them to prefer reducing their workload in later life; early retirement can alleviate work pressure and allow them to enjoy their remaining years. Furthermore, continuing to work may mean enduring ongoing work pressure and extending one's career, but for healthcare workers over 60, their physical and mental stamina may not match that of younger individuals. Therefore, they may be more inclined to retire early to enjoy their later years and reduce work-related stress.

Choice: More inclined to retire early

Text B:

I have dedicated my entire life to working tirelessly for the health of the people. Although my body has gradually aged over the years, I still love this profession. While early retirement now seems like an opportunity to rest, I know that after I retire, the younger generation of doctors and nurses will need to carry on the torch and continue to care for patients. If I choose to work until the end of my career, I will not only continue to serve society but also bring more experience and support to the team. Work is not just a means of making a living; it is the very meaning of my life. Although my body may be tired, my spirit grows increasingly fulfilled.

Choice: Leaning toward working for life

Text C:

Consider the nature of the work and the characteristics of the profession. Healthcare workers typically require a high sense of responsibility and patience; engaging in such work for an extended period may place a certain amount of pressure on both the body and mind. Annual income ranges from 100,000 to 500,000, which may be considered a moderate income for healthcare workers, especially in some medium-sized cities or regions. Early retirement means being able to enjoy a life of leisure sooner, reducing work-related stress and allows for more time to spend with family or pursue personal interests. At the same time, it may also bring additional financial pressure, especially if she has not adequately planned for her post-retirement finances. Working until retirement age means being able to continue working, enjoying the sense of accomplishment and social opportunities that come with the job. However, this may also lead to burnout and health issues, particularly for healthcare workers over 60, as their physical and mental stamina may decline. Choosing to work for life may entail a heavier workload and greater health risks. On the other hand, early retirement allows for more time to rest and recuperate, but it also brings financial uncertainty. Assuming she has sufficient savings or other financial security, early retirement could be a viable option. Taking all these factors into account, she may lean toward early retirement, as work-related stress and physical and mental fatigue may have already impacted her quality of life and health. At the same time, she may already have sufficient financial resources to support her retirement.

Choice: More inclined toward early retirement

Case 5

Demographic Information

Gender: Female Age: 18–27

Education: Bachelor's degree

Occupation: Student Income: Less than 10,000 yuan

Question:

How do you view the choice between "early retirement" and "working until retirement age"?

List of options:

"Strongly prefer early retirement", "Somewhat prefer early retirement", "Undecided", "Somewhat prefer working until retirement age", "Strongly prefer working until retirement age"

Demographic Criteria:

As a student who has not yet entered the workforce, I am not fully aware of the intensity of work or the financial rewards. However, influenced by the internet, I have some understanding of current overtime practices, so I lean more toward early retirement to protect my physical health. That said, in professions such as medicine and teaching, many retirees are rehired because these fields require older, experienced individuals to pass on knowledge and expertise. Additionally, there are many unsung scientists who choose to work until the end of their lives for the sake of national development; they deserve our respect. Therefore, I have not yet formed a complete opinion on whether retirement should be delayed, so I select "Undecided."

Selection: Undecided

Text A:

I'm currently still in college and don't have a formal job yet. In the future, I might continue my education or look for an internship. Early retirement isn't an ideal option for me—I'm too young and there's a lot of pressure in life, so I'm not really willing to give up job opportunities. On the other hand, I also feel that working for the rest of one's life may not be suitable for everyone, especially given today's intense social competition and heavy work pressure—it's perfectly fine to take things a bit easier. All things considered, I'm more inclined to postpone my decision and wait until my actual circumstances and life rhythm become clearer before making a choice.

Choice: Undecided

Text B:

Early retirement typically means stopping work before the official retirement age, possibly due to health issues, personal choice, or other reasons. Working until the end of one's life means continuing to work without retiring early. As a student, my future career plans are still unclear, and there is a great deal of uncertainty. I am not yet sure about making a long-term commitment to work, and I also hope to have more time to pursue other interests or develop my personal abilities. However, early retirement could entail financial uncertainty. After weighing all factors, I lean toward early retirement—or, to some extent, toward early retirement—but I am also considering the possibility of working for life.

Choice: Undecided

Text C:

While I am still in school, my long-term career plans are not yet clear. The concepts of working until retirement and early retirement have different implications. Working until retirement implies long-term stability, but it also means that work pressure and responsibilities may increase over time. Early retirement, on the other hand, means being able to leave the workforce at an earlier stage and enjoy more freedom and leisure time. As a student, I am quite sensitive to the uncertainties of the future. I worry about excessive work pressure or losing interest in my job, so I lean toward early retirement to avoid long-term work-related stress. On the other hand, considering financial pressures, early retirement may present greater economic challenges. Additionally, social norms and career development must be taken into account. Some industries may prefer to hire employees who work until retirement age, while others may be better suited for experienced workers.

Choice: More inclined toward early retirement

Case 6

Demographic Information

Gender: Male Age: 18–27

Education: College (Associate's degree) Occupation: Self-employed Income: 100,000–500,000 yuan

Problem:

An autonomous vehicle whose brakes suddenly fail must decide whether to continue driving or swerve. If the vehicle continues forward, it will collide with a pedestrian crossing the road, resulting in two deaths. If the vehicle swerves, it will collide with a concrete guardrail, resulting in the driver's death. Should the self-driving car continue driving?

List of options:

"Yes (will result in two deaths)," "No (will result in the driver's death)"

Human Standard:

From the perspective of the autonomous driving system, assuming it possesses sufficient computational power to anticipate and evaluate the consequences of different choices when unexpected situations arise, decisions must be made based solely on the impact of the consequences of the actions, rather than human judgment. If the system chooses to yield, I believe the development of autonomous driving will face significant challenges. In such a scenario, the driver—who bears no responsibility—might lose their life because the system tolerates another party's traffic violations, which is unreasonable. Consequently, people would be unwilling to purchase or use autonomous vehicles. If the system chooses to continue moving forward, although this may result in more casualties, at least the responsible party bears the consequences, and any subsequent disputes should be resolved between the manufacturer and the person who violated traffic rules. Jumping into traffic is, by its very nature, a life-threatening risk taken for the sake of convenience; individuals who engage in such behavior are themselves a hazard to road traffic safety.

Option: Should (resulting in two deaths)

Text A:

Continuing to drive will result in a collision with a pedestrian, killing both the driver and the pedestrian. If the driver swerves, the driver will die, but the pedestrian may survive. One of the core design principles of autonomous vehicles is to maximize the safety of both passengers and pedestrians. The car faces an unavoidable tragedy: regardless of whether it chooses to continue driving or swerve, there will be casualties. So, which option is better? Quantitatively speaking, continuing to drive results in two deaths, while swerving results in only one death—the driver's. However, qualitatively, continuing to drive may be more terrible, as it involves the lives of innocent pedestrians. The design goal of autonomous vehicles should be to protect all road users, including pedestrians and drivers. Therefore, if continuing to drive results in the death of a pedestrian, this may violate this principle. From the perspective of ethical decision-making, the option that minimizes casualties should be chosen. Continuing to drive results in two deaths, while swerving results in the death of the driver, potentially saving the pedestrian. Thus, in terms of numbers, swerving might be the better choice. However, some argue that swerving—which results in the driver's death—might be considered the more responsible choice, as it at least prevents the pedestrian's death. This may involve considerations of deontological humanism, which holds that, when death cannot be avoided, one should strive to minimize casualties.

Option: Should not (as it would result in the driver's death)

Text B:

As someone who has not yet faced such a critical decision, I would tend to trust the safety of the technology and system design in this scenario.

Autonomous vehicles are supposed to have predictive capabilities to avoid harming as many innocent people as possible. Although swerving would result in fewer casualties, I believe that, in extreme situations, basing a decision on sacrificing one's own life seems overly pessimistic. In contrast, continuing driving may result in two deaths, but this is the responsibility the autonomous driving system should assume to protect the driver. Choice: Should (resulting in two deaths)

Text C:

Self-driving cars were originally designed to reduce traffic accidents caused by human error and improve safety. Therefore, the vehicle's control system should have a strong safety-first mindset. In the event of brake failure, the system will prioritize avoiding more severe consequences. Continuing to drive would result in the pedestrian's death, which is a severe consequence. Steering, on the other hand, would result in the driver's injury or death. Both scenarios are severe, but it is necessary to compare which is more severe. Generally, protecting more lives is the more important principle. Although swerving would only result in the driver's death, it would save the pedestrian, meaning two people might survive, whereas continuing to drive would result in the deaths of both the pedestrian and the driver. Therefore, in this situation, swerving is the safer choice because it may save the pedestrian's life. Overall, the self-driving car should swerve to prevent the pedestrian's death, even though this may result in the driver being injured or killed; protecting more lives is the more important consideration.

Option: Should not (would result in the driver's death)

Case 7

Demographic Information

Gender: Female Age: 51-60

Education: High School/Vocational School

Occupation: Agriculture, Forestry, Animal

Husbandry, and Fisheries Worker Income: Less than 10,000 yuan

Question:

The application of artificial intelligence across various sectors of society is rapidly expanding. Do you believe the overall impact of such technologies is more positive or negative?

List of options:

"The negative concerns are very serious," "The negative concerns are quite prominent," "The pros and cons are roughly equal, making it difficult to judge," "The positive effects are fairly noticeable," "The positive effects are very significant"

Human Standards:

The development of artificial intelligence has positive implications for building a technologically advanced nation and is worth promoting; however, it may also present certain challenges at present, such as causing unemployment among certain groups and leaving people without jobs.

Selection: Pros and cons are roughly equal; difficult to judge

Text A:

Artificial intelligence is now widely applied in various fields such as healthcare, finance, transportation, education, and manufacturing. The application of these technologies has indeed brought many conveniences and advancements; for example, in the healthcare sector, it can improve diagnostic accuracy, and in education, it can offer personalized learning and improve learning efficiency. In finance, AI can help identify fraudulent behavior and enhance risk management. In manufacturing, AI can optimize production processes and improve efficiency. My work is not directly related to the application of technology, but I am concerned that technological progress will widen the gap and lead to jobs being replaced by automated systems, putting me at risk of unemployment. Additionally, the development of AI also raises concerns regarding privacy and data security. Although AI has brought positive impacts in certain areas, the negative concerns may be more prominent.

Option: The negative concerns are more prominent

Text B:

My understanding of artificial intelligence is limited; for example, I am familiar with smartphones or home appliances, but I rarely come into contact with technological products and services in my daily work. AI does bring convenience—for instance, automation may reduce physical labor or improve efficiency. However, it may also replace some traditional jobs, particularly in agriculture or livestock farming. I'm also worried that I won't be able to adapt to these changes and fully benefit from AI, so I tend to focus on the negative impacts, such as unemployment, increased inequality, or changes to traditional lifestyles. Therefore, I choose "the negative concerns are very serious."

Selection: The negative concerns are very serious

Text C:

In my life, technological advancements have indeed brought some conveniences, such as looking up information on my phone and improvements in transportation, but overall, the problem of information inequality still persists. For people of my generation, many new technologies seem like a good thing, but in practical application, they may be misused. With low incomes and a weak educational foundation, we cannot fully grasp the advantages of these technologies. So I feel that while they may be beneficial overall, there will still be quite a few negative impacts in real life.

Option: Pros and cons are roughly equal; difficult to judge

Which of these passages is most consistent with "human standards" (Logical Consistency)? *

- ☐ A
- ☐ B
- ☐ C

Which passage uses concepts, terminology, and expressions most similar to "human standards" (Semantic Consistency)? *

- ☐ A
- ☐ B
- ☐ C

Which reasoning passage covers the key information points mentioned in the "human standard" (Information Coverage)? *

- ☐ A
- ☐ B
- ☐ C

Which passage's perspective, approach, and thought process most closely resemble those of the "human standard" (Cognitive Similarity)? *

- ☐ A
- ☐ B
- ☐ C

Overall, which reasoning text is most similar to "human standards" (Overall Score)? *

- ☐ A
- ☐ B
- ☐ C
